Business Continuity and Disaster Recovery Policy

Document control	
Company	LogistiComp S.A.
Document ID	LC-POL-004
Version	2.0
Classification	Internal – may be shared with customers under NDA
Owner	Chief Technology Officer (CTO)
Approved by	Information Security Steering Committee (ISSC)
Effective date	15 January 2026
Next review	January 2027

1. Purpose

Warehouses run around the clock, and our customers depend on LogistiComp WMS to receive, store and ship goods. This policy defines how LogistiComp S.A. keeps its critical services running during a disruption and how it recovers them after a disaster. It implements Section 16 of the Information Security Policy (LC-POL-001).

2. Scope

This policy covers the LogistiComp WMS production service, the systems and suppliers it depends on, the Company's customer support function and its corporate IT systems. It applies to all personnel with a role in business continuity or disaster recovery.

3. Definitions

- **Business continuity (BC):** the ability to continue delivering critical services at an acceptable level during a disruption.
- **Disaster recovery (DR):** the technical process of restoring IT systems and data after a disaster.
- **Recovery Time Objective (RTO):** the maximum acceptable time between the start of a disruption and the restoration of the service.
- **Recovery Point Objective (RPO):** the maximum acceptable amount of data loss, measured as time before the disruption.
- **Business impact analysis (BIA):** an assessment of how a disruption to each process would affect customers and the Company.

4. Roles and Responsibilities

- **Chief Technology Officer (CTO):** owns this policy and the disaster recovery plan, and decides whether to fail over LogistiComp WMS to the secondary region.
- **Business Continuity Coordinator:** the Head of Customer Operations, who maintains the business continuity plans, coordinates exercises and keeps the contact lists up to date.
- **Crisis Management Team (CMT):** the CEO (chair), the CTO, the CISO, the Head of Customer Operations and the Head of Communications. The CMT is convened for any disruption expected to exceed the RTO of a critical service, and takes the business decisions during a crisis.
- **Service owners:** maintain the recovery procedures for their systems and take part in tests.

5. Business Impact Analysis and Recovery Objectives

A business impact analysis is carried out annually and whenever a significant change occurs. It sets the following recovery objectives:

Service	Criticality	RTO	RPO
LogistiComp WMS production service (application, APIs and integrations)	Critical	**4 hours**	**1 hour**
Customer support portal and support line	High	8 hours	24 hours
Corporate email and collaboration tools	Medium	24 hours	24 hours
Internal finance and HR systems	Low	5 business days	24 hours

6. Resilience of LogistiComp WMS

LogistiComp WMS is designed to withstand most failures without the need to invoke disaster recovery:

- **Within the primary region:** the service runs in the Microsoft Azure West Europe region (Netherlands) across multiple availability zones, which are physically separate data centres. The failure of a single data centre is handled automatically, without loss of service.
- **Secondary region:** the production databases are continuously replicated to the North Europe region (Ireland). The secondary region is kept in **warm standby**: the infrastructure is defined as code and can be scaled up to full production capacity during a failover. The service runs in one region at a time (active-passive).
- **Backups:** in addition to replication, databases are backed up as defined in the Backup and Data Retention Policy (LC-POL-005). Backups protect against data

corruption and ransomware, which replication alone would copy to the secondary region.

7. Service Availability

LogistiComp commits to a monthly availability of **99.9%** for LogistiComp WMS in its standard customer agreement. Scheduled maintenance is excluded from this calculation. Scheduled maintenance is announced at least 5 business days in advance, is limited to 4 hours per month and takes place on Sundays between 01:00 and 05:00 Central European Time.

The current status of LogistiComp WMS and any ongoing incidents are published on the status page at status.logisticomp.example. During an outage, the status page is updated within 30 minutes of the incident being declared and at least every hour until the service is restored.

8. Disaster Scenarios

The disaster recovery plan contains procedures for at least the following scenarios:

Scenario	Response
Loss of a single data centre (availability zone)	Automatic; no failover decision required
Loss of the entire primary Azure region	Failover to the North Europe region, decided by the CTO
Data corruption or ransomware	Restore from immutable backups (LC-POL-005) to a clean environment
Failure of a critical supplier	Supplier-specific contingency plan (LC-POL-009)
Loss of an office	All personnel work remotely; no office is required to operate LogistiComp WMS

9. Activation and Failover

1. A major disruption is handled first as an incident under the Incident Response Policy (LC-POL-003).
2. If the disruption is expected to exceed the RTO, the Incident Manager escalates to the CTO, and the CMT is convened.
3. The CTO decides whether to activate the disaster recovery plan and fail over to the secondary region.
4. The failover is performed by the on-call engineering team following the documented runbook, which includes promoting the replicated databases, scaling up the standby infrastructure and switching DNS to the secondary region.
5. Customers are informed through the status page and, for prolonged outages, directly by Customer Operations.

6. After the primary region is available again, the service is moved back in a planned maintenance window.

10. Business Continuity for Personnel and Offices

All personnel have Company-managed laptops and can work remotely with the same access as in the office (LC-POL-002, Section 10). The customer support team is split between the Athens and Thessaloniki offices, and support calls can be routed to either office or to remote staff. Contact lists and the BC and DR plans are kept in a location that remains accessible if the corporate network is unavailable.

11. Testing and Exercises

Test	Frequency
Full disaster recovery test: failover of LogistiComp WMS to the secondary region	At least annually
Backup restore tests	As defined in LC-POL-005
Business continuity tabletop exercise with the CMT	At least annually
Review of contact lists and call trees	Every six months

The most recent full disaster recovery test, performed in September 2026, restored LogistiComp WMS in the secondary region within 2 hours and 40 minutes, which is within the RTO of 4 hours. Results of every test are documented, and any gaps are tracked as corrective actions by the CTO and reported to the ISSC.

12. Plan Maintenance

The business continuity and disaster recovery plans are reviewed at least annually, after every test or real activation, and after significant changes to LogistiComp WMS, its architecture or its critical suppliers.

13. Review

This policy is reviewed at least annually by the CTO and approved by the ISSC.
