Backup and Data Retention Policy

Document control	
Company	LogistiComp S.A.
Document ID	LC-POL-005
Version	1.6
Classification	Internal – may be shared with customers under NDA
Owner	Chief Technology Officer (CTO)
Approved by	Information Security Steering Committee (ISSC)
Effective date	15 January 2026
Next review	January 2027

1. Purpose

This policy defines how LogistiComp S.A. backs up its data so that it can be recovered after loss, corruption or a ransomware attack, and how long different types of data are kept before they are deleted. It supports the recovery objectives in the Business Continuity and Disaster Recovery Policy (LC-POL-004) and the data protection principles in the Privacy Policy (LC-POL-006).

2. Scope

This policy applies to all data held by LogistiComp, including customer data in LogistiComp WMS, logs, and the Company's own business records, in all environments and storage locations.

3. Roles and Responsibilities

- **Chief Technology Officer (CTO):** owns this policy and the backup infrastructure.
- **Database operations team:** runs and monitors backups, performs restore tests and carries out restores.
- **Data owners:** make sure the data they are responsible for is kept and deleted according to the retention schedule in Section 7.
- **Data Protection Officer (DPO):** verifies that retention periods for personal data comply with the GDPR.

4. Backup Requirements for LogistiComp WMS

Item	Requirement
Frequency	Full database backup daily; incremental backups **every hour**

Item	Requirement
Retention of backups	**35 days**, after which backups are deleted automatically
Storage location	Primary copy in the West Europe region; geo-redundant copy in the North Europe region
Encryption	All backups are encrypted with AES-256 (see LC-POL-008)
Immutability	Backups are stored in immutable (write-once) storage and cannot be changed or deleted before the end of their retention period, even by administrators
Isolation	Backups are kept in a separate Azure subscription, with separate administrator accounts from the production environment
Monitoring	Every backup job is monitored; a failed backup creates an alert to the on-call engineer

Hourly incremental backups support the Recovery Point Objective of 1 hour for LogistiComp WMS defined in LC-POL-004. Immutability and isolation protect backups against ransomware and against mistakes or malicious actions by a single administrator.

Application servers are not backed up, because they are rebuilt from infrastructure-as-code templates and versioned container images. Source code is stored in the Company's version control system, which is backed up daily.

5. Restoring Data

- Restores to the production environment require approval by the CTO or, outside business hours, by the on-call engineering manager.
- Every restore is logged and recorded in a change ticket (LC-POL-007).
- Restores are first performed into an isolated environment, where the data is checked before it is moved to production.

6. Restore Testing

A restore test is performed **every quarter**. In each test, a production database backup is restored into an isolated environment, its integrity is verified and the time needed for the restore is recorded. Results are documented, and failed or slow restores are treated as corrective actions and reported to the ISSC.

7. Data Retention Schedule

Data is kept only as long as it is needed for the purpose for which it was collected, or as long as required by law or contract. After the retention period ends, data is deleted securely or anonymised.

Type of data	Retention period
Customer data in LogistiComp WMS	For the duration of the customer agreement, then deleted as described in Section 8
Tenant audit logs (visible to customer administrators)	24 months
Security event logs (SIEM)	6 months
Application and diagnostic logs	30 days
Database backups	35 days
Security incident records	3 years
Customer support tickets	3 years after the ticket is closed
Customer contact data (CRM)	For the duration of the business relationship plus 2 years
Contracts and invoices	As required by Greek commercial and tax law
Employee records	As required by Greek employment and tax law
Source code	Kept indefinitely in version control

8. Customer Data at the End of a Contract

1. **Export:** during the agreement and for **30 days after it ends**, the customer can export all of its data from LogistiComp WMS through the API or as CSV files.
2. **Deletion from production:** all customer data is deleted from the production environment **within 90 days after the end of the agreement**.
3. **Deletion from backups:** deleted data disappears from backups as they expire, because backups are kept for no longer than 35 days. Backups are never restored to recover the data of a former customer.
4. **Confirmation:** on request, LogistiComp provides the customer with a written confirmation of deletion.

9. Secure Deletion

Data in Azure storage is deleted using the cloud provider's deletion mechanisms. Because all data is encrypted (LC-POL-008), deleting the relevant encryption keys makes any remaining copies unreadable. Company laptops are wiped securely before they are reused or disposed of, and storage media are destroyed according to the Removable Media Policy (LC-POL-010).

10. Legal Hold

If data is needed for a legal claim, an investigation or a request from an authority, the CEO, on the advice of legal counsel, can place it under legal hold. Data under legal hold is not deleted until the hold is lifted, even if its retention period has ended.

11. Review

This policy is reviewed at least annually by the CTO, together with the DPO, and approved by the ISSC.
