Change Management Policy

Document control	
Company	LogistiComp S.A.
Document ID	LC-POL-007
Version	1.9
Classification	Internal – may be shared with customers under NDA
Owner	Chief Technology Officer (CTO)
Approved by	Information Security Steering Committee (ISSC)
Effective date	15 January 2026
Next review	January 2027

1. Purpose

This policy makes sure that changes to LogistiComp WMS and its supporting infrastructure are planned, reviewed, tested, approved and recorded, so that they do not cause unplanned outages, security weaknesses or data loss for our customers.

2. Scope

This policy applies to all changes to:

- the LogistiComp WMS application, its APIs and its integrations;
- the production infrastructure and Microsoft Azure configuration, including networks, databases and access settings;
- security tools such as the SIEM, endpoint protection and firewalls;
- critical corporate systems, such as Microsoft Entra ID.

Changes to development and test environments are outside the scope of this policy, unless they affect the build and deployment pipeline.

3. Roles and Responsibilities

- **Chief Technology Officer (CTO):** owns this policy and chairs the Change Advisory Board.
- **Change Advisory Board (CAB):** meets weekly and consists of the CTO, the engineering leads, the CISO or a delegate, and the Head of Customer Operations. The CAB approves normal changes and reviews emergency changes.
- **Change requester:** the engineer who raises and documents the change.
- **Change implementer:** the person or automated pipeline that carries out the change.

4. Types of Change

Type	Description	Approval
Standard	Low-risk, repeatable change following a documented procedure, such as a regular software release through the deployment pipeline	Pre-approved by the CAB as a change type; individual changes need the reviews in Section 6
Normal	Any change that is not standard or emergency, for example a database schema migration or a change to network configuration	CAB approval before implementation
Emergency	Urgent change needed to resolve a SEV1 or SEV2 incident (LC-POL-003) or to fix a critical vulnerability (LC-POL-001, Section 11.2)	CTO or on-call engineering manager; reviewed by the CAB within 5 business days

5. Change Records

Every change is recorded in a change ticket, which contains:

- a description of the change and the reason for it;
- an assessment of the risk and the impact on customers;
- evidence of testing;
- a rollback plan;
- the required approvals;
- the planned time of implementation and the result.

6. Software Release Process

1. All code is kept in the Company's version control system. Changes are made in separate branches and merged through pull requests.
2. Every pull request is reviewed and approved by at least one engineer other than its author.
3. The build pipeline runs automated tests, static application security testing (SAST) and dependency vulnerability scanning. Failed tests or critical security findings block the change.
4. Changes are deployed to a staging environment and tested there before they reach production.
5. Deployment to production is approved by a person other than the author of the change. No one can both develop a change and approve its deployment (segregation of duties, LC-POL-002, Section 3).
6. Changes reach production **only through the automated deployment pipeline**. Manual changes to the production environment are not permitted, except in emergency changes performed through the bastion host (LC-POL-002, Section 6).

7. Deployments use a rolling method. If health checks fail after a deployment, the change is rolled back automatically.

Infrastructure changes follow the same process: infrastructure is defined as code, changes are reviewed in pull requests and applied through the pipeline.

7. Release Schedule and Customer Communication

- Regular releases of LogistiComp WMS are deployed **weekly**, without downtime. Release notes describing new features and fixes are published to customers for every release.
- Changes that require downtime are performed only during the scheduled maintenance window, on Sundays between 01:00 and 05:00 Central European Time, and announced at least 5 business days in advance (see LC-POL-004, Section 7).
- **Breaking changes to the LogistiComp WMS APIs** are announced to customers at least **6 months** in advance. During this period, the previous API version remains available.

8. Peak Season Change Freeze

Our customers handle their highest volumes in the weeks before the end of the year. To protect their operations, a change freeze applies every year **from 15 November to 10 January**. During the freeze, only emergency changes and changes explicitly approved by the CTO are deployed to production.

9. Unauthorised Changes

The configuration of the production environment is continuously compared with the approved configuration defined in code, using Azure Policy and automated drift detection. Any change made outside this process is treated as a security incident under LC-POL-003.

10. Post-Implementation Review

Failed changes and changes that caused an incident are analysed in a post-implementation review, and lessons learned are recorded in the change ticket. The rate of successful changes and the number of emergency changes are reported to the ISSC every quarter.

11. Review

This policy is reviewed at least annually by the CTO and approved by the ISSC.
